

```
[imageData writeToFile:[self filePath:@"MyPicture.
png"] atomically:YES];
}
```

You also need to add the MediaPlayer framework to your project. To accomplish this, just right-click on the Frameworks group in Xcode and click on **Add > Existing Frameworks** and select Frameworks/MediaPlayer.framework. Once you've done this, you can import this into your PhotoLibraryAccessViewController.h file with the `#import <MediaPlayer/MediaPlayer.h>` statement at the top of it.

After this, edit the PhotoLibraryAccessViewController.m file to look like this:

```
- (void)imagePickerController:(UIImagePickerController
*)picker
didFinishPickingMediaWithInfo:(NSDictionary *)info {
    UIImage *image;
    NSURL *mediaUrl;
    mediaUrl = (NSURL *)[info valueForKey:UIImagePickerCont
rollerMediaURL];
    if (mediaUrl == nil)
    {
        image = (UIImage *) [info valueForKey:UIImagePickerCont
rollerEditedImage];
        if (image == nil)
        {
            //original image selected
            image = (UIImage *)
            [info valueForKey:UIImagePickerControllerOriginalIma
ge];
            //display the image
            imageView.image = image;
            //save the image captured
            [self saveImage];
        }
        else
        {
            //edited image picked
            //get the cropping rectangle applied to the image
            CGRect rect =
```
