

```
[mapView release];  
[lm release];  
[latitudeTextField release];  
[longitudeTextField release];  
[accuracyTextField release];  
[super dealloc];  
}
```

Save the project and press **[command] + [R]** to start the application on the iPhone Simulator. When you click on the View Map button that you created, you will see that a map will be displayed with the location set to your present location, which in the case of the Simulator application is fixed. You will need an actual iPhone implementation to see if its actually working correctly.
