

```

@interface FTAppDelegate : NSObject <
UIApplicationDelegate > {
    UIWindow *window;
    NewVC *NewVC;
}
@property (nonatomic, retain) IBOutlet UIWindow *window;
@property (nonatomic, retain) NewVC *NewVC;
@end

```

Now move to the FTDelegate.m file, and insert the following code in order to create an instance of the NewVC class and set the view to the current window.

```

#import "FTAppDelegate.h" // imports the header file
                           declared above
#import "NewVC.h"

@implementation FTAppDelegate
@synthesize window;
@synthesize NewVC;
- (void)applicationDidFinishLaunching:(UIApplication *)
application {
    //The code below is the actual code which creates
    the instance for the NewVC class
    NewVC *viewController = [[NewVC alloc]
                               initWithNibName:@"NewVC"
                               bundle:[NSBundle
mainBundle]];
    //-----
    self.NewVC = viewController;
    [viewController release];

    // adding the physical "View" to the viewcontroller.
    [window addSubview:[NewVC view]];

    [window makeKeyAndVisible];
}

//Below is an exhibit in good programming practices.

```
