

```
- (void)dealloc {  
    [NewVC release];  
    [window release];  
    [super dealloc];  
}  
@end
```

Now you can build and run your app and blank view will be displayed in your iPhone Simulator indicating that you have successfully added a view controller manually in an application.

You can again open the NewVC.xib file and customize it the way you want. From this step onward you can work the same way as before to create any application.
