

same hierarchy.

Name the two Round Rect Buttons as “Button 1” and “Button 2” from their respective inspector window, and put them in View1 and View 2.

Modify your SegCViewController.h file to add the following outlets:

```
#import <UIKit/UIKit.h>
@interface SegCViewController
: UIViewController {
    IBOutlet UIView *view1;
    IBOutlet UIView *view2;
    IBOutlet UISegmentedControl
*segmentedControl;
}
```

```
@property (nonatomic, retain)
```

```
UIView *view1;
```

```
@property (nonatomic, retain)
```

```
UIView *view2;
@property (nonatomic, retain) UISegmentedControl
*segmentedControl;
```

```
@end
```

Now you need to connect the declared outlets above to their respective views. This can be done graphically via the Interface Builder. After you have connected them, it is time to implement the action, for which open Xcode and edit the SegCViewController.m

```
#import "SegCViewController.h"
@implementation SegCViewController
@synthesize segmentedControl;
@synthesize view1, view2;
- (void) viewDidLoad {
    //The event handler for the segment control, by the
    name of segmentChanged
    [segmentedControl addTarget:self action:@
selector(segmentChanged:)
    forControlEvents:UIControlEventValueChanged];
    [super viewDidLoad];
}
```
