

```
@implementation KbViewController
-(IBAction) vanish:(id) sender{
    [sender resignFirstResponder];
}
```

Now save, build and run your project. This will launch the application in the simulator. As expected, the keyboard will appear when you click on the “TextField” view and disappear as you press the return key. So far so good, but what if there is no return key as in the case of Number Pad? The first step is to set the keyboard type as numeric pad. To do this, open the kbViewController.xib file in the interface builder, then select the TextField View and open its Attribute inspector from the tools menu. Under the text input traits, change the keyboard type to Number Pad. Now select the “File’s Owner” item in the kbViewController.xib window and view its identity
