

```

        UIButton *button6;
    }
    @property (nonatomic, retain) IBOutlet UIButton *button1;
    @property (nonatomic, retain) IBOutlet UIButton *button2;
    @property (nonatomic, retain) IBOutlet UIButton *button3;
    @property (nonatomic, retain) IBOutlet UIButton *button4;
    @property (nonatomic, retain) IBOutlet UIButton *button5;
    @property (nonatomic, retain) IBOutlet UIButton *button6;
@end

```

Now you have to link them. For this open the interface builder by double-clicking on the MoveItViewController.xib file and Control-drag from the “File’s Owner” icon to each of the six buttons, and select the respective action for each from the pop-up.

Now you need to edit the MoveItViewController.m file to manually override the default rotation policy. For this open the file and edit it as following

```

#import "MoveItViewController.h"
@implementation MoveItViewController
//To auto create accessors and mutators for each //
configuration
    @synthesize button1;
    @synthesize button2;
    @synthesize button3;
    @synthesize button4;
    @synthesize button5;
    @synthesize button6;
    //Manual overriding of the default rotation mechanism.
    || //signifies OR, so that in both cases of portrait
    orientation //the same behaviour is observed, normal or
    upside down.
    - (void)willAnimateRotationToInterfaceOrientation:(UIIn
    terfaceOrien
        interfaceOrientation duration:(NSTimeInterval)
    duration {
        if (interfaceOrientation ==
    UIInterfaceOrientationPortrait
        || interfaceOrientation ==
    UIInterfaceOrientationPortraitUpsideDown) {

```
