

9.4 Using the drag gesture

This refers to as tapping an item on the screen and then dragging it by just moving your finger. It is very easy to implement. Open the same project and make the size of the UIImageView smaller so that you can drag it across the screen. Then open the TouchDetectionViewController.m file and edit the touchesMoved:withEvent: method in this way:

```
-(void) touchesMoved: (NSSet *) touches withEvent:
(UIEvent *) event {
    //get all touches on the screen
    NSSet *allTouches = [event allTouches];
    //compare the number of touches on the screen
    switch ([allTouches count])
    {
        //single touch
        case 1: {
            //get info of the touch
            UITouch *touch = [[allTouches
            allObjects] objectAtIndex:0];
            //check to see if the image is being touched
            CGPoint touchPoint = [touch locationInView:[self view]];
            if (touchPoint.x > imageView.frame.origin.x &&
            touchPoint.x < imageView.frame.origin.x +
            imageView.frame.size.width &&
            touchPoint.y > imageView.frame.origin.y &&
            touchPoint.y < imageView.frame.origin.y +
            imageView.frame.size.height) {
                [imageView setCenter:touchPoint];
            }
            } break;
        //double-touch
        case 2: {
            //get info of first touch
            UITouch *touch1 = [[allTouches allObjects]
            objectAtIndex:0];
            //get info of second touch
            UITouch *touch2 = [[allTouches allObjects]
            objectAtIndex:1];
            //get the points touched
```
