

logo of Digit and display it on the screen at different places in a short interval making it look as if the logo is animated and moving around the screen. The frequency and the way it reacts on going to any one side will also be controlled by code.

Create a new View-based Application project in Xcode. We will call it AnimatedLogo. Now drag and drop the logo of Digit, i.e., digit.jpeg in the Resources folder in Xcode. If the Add dialog box opens up, just select Copy Item into Destination Group's Folder check box to make sure that a copy of image is copied into the project. Next, open the AnimatedLogoViewController.xib in the Interface Builder by double-clicking on it. Go to the View window, and drag an UIImageView onto it. Also set its Image property to digit.jpeg. To control the animation, let's also add a Slider view and Label it with a Label view from the library. Make sure you set the Initial property of the Slider View to 0.01.

Open the AnimatedLogoViewController.h file now and declare the following fields, outlets and actions:

```
#import <UIKit/UIKit.h>

@interface AnimatedLogoViewController : UIViewController
{
    IBOutlet UIImageView *imageView;
    IBOutlet UISlider *slider;
    CGPoint position;
    NSTimer *timer;
    float logoRadius;
}
@property (nonatomic, retain) UIImageView *imageView;
@property (nonatomic, retain) UISlider *slider;
-(IBAction) sliderMoved:(id) sender;
@end
```

Go back to the Interface Builder and connect the imageView, slider and view outlets to the sliderMoved action. Then open the AnimatedLogoViewController.m file and add the following code to it:

```
#import "AnimatedLogoViewController.h"
@implementation AnimatedLogoViewController
@synthesize imageView;
@synthesize slider;
```

//In the onTimer method, we will change the position of the ImageView by setting its center property to a new
