

profiles of some of the people working in your organization, you will have an idea of how exposed it is. Disgruntled employees might publicly state their problems via social channels, and conversations between employees on social networks – which should have been conducted privately – can give away a lot of information.

Google is god here, and with a few specific searches can reveal a lot of information which people would rather have kept private. For example, many services or applications running on the target system might provide remote administration interfaces that might not be secured.

A router configuration page can give you access to the username and password
