

vbesave

This service monitors the Video BIOS real-time configuration. This is an ACPI function and is usually used on laptops when switching between the laptop display and an external display. If your computer does not support ACPI or does not switch between displays, then you do not need this service.

Although there are many services that you probably do not need, there are a few that are essential. You should not turn off these essential services unless you really know what you are doing:

dbus

Provides messaging services.

gdm

This is the Gnome Desktop. Only disable this if you do not want a graphical desktop.

klogd

This is the kernel log daemon. Removing it disables system logging.

makedev and udev

These create all device nodes.

module-init-tools

Loads kernel modules specified in `/etc/modules`.

networking and loopback

These start and stop the network. Disabling removes the network configuration at boot.

procps.sh

Any kernel tuning parameters added to `/etc/sysctl.conf` are processed by this service.

urandom

This seeds the real random number generator that is used by most cryptographic systems. You should leave it enabled.

As a rule of thumb, if you do not know what it is, then leave it on. Also, if the service only runs in single-user mode (rcS) that it is usually smart to not change it. Single user mode is where you should go when everything fails in order to repair the system
