

```
user@host:/home/user$ sudo chown PQR:XYZ foobar
```

4.2 Posix ACLs

If you're not satisfied with the standard UNIX file permissions, you can use the Posix ACLs from the `acl` package to achieve a finer granularity of permissions. To enable Posix ACLs, you need to install the `acl` package by the following command:

```
sudo apt-get install acl
```

Once that's done, you can use the Eiciel package from the repository that grants you GUI access to ACLs through the Nautilus file manager.

4.3 File removal

If you want to remove a file you cannot delete, you can use the following command:

```
sudo rm -rf filename
```

4.4 Sticky Bit

The Sticky bit prevent users from altering or replacing any other user's files. So, it is advisable that all public directories be configured with sticky bit using the command:

```
chmod u+t <directory>
```

The `u` here adds the sticky bit to the user; `g` adds it to the group; and `o` adds it for others. The `+` means that you are adding the sticky bit. If you want to later remove it, you can replace it with a `-`.
