

```
INSERT INTO domains (domain) VALUES
    ('localhost'),
    ('localhost.localdomain');
```

These are some default mail aliases:

```
INSERT INTO aliases (mail,destination) VALUES
    ('postmaster@localhost','root@localhost'),
    ('sysadmin@localhost','root@localhost'),
    ('webmaster@localhost','root@localhost'),
    ('abuse@localhost','root@localhost'),
    ('root@localhost','root@localhost'),
    ('@localhost','root@localhost'),
    ('@localhost.localdomain','@localhost');
```

Then insert a root user:

```
INSERT INTO users (id,name,maildir,encrypt) VALUES
('root@localhost','root','root/', encrypt('apassword') );
```

You can now now add more users or domains based on your needs.
