

```
h2 {  
font-size:140%;  
}  
h3 {  
font-size:120%;  
}  
/* Default paragraph styles */  
p {  
font-size:100%;  
line-height:150%;  
}
```

The style sheet contains nothing special at this stage, just a few simple rules to control the look of the text, and a 10-pixel margin on the body element.

9.3 Liquid floated two-column layout

The goal is to create a simple two-column layout, featuring a main column and a sidebar that stretches to fit the width of the browser window. All examples in this chapter will involve two main sections, masthead and footer. They are almost always required in any layout, especially when first getting to grips with CSS layout. The masthead (also called the header) stretches the full width of the layout and typically holds a logo and possibly the main navigation, plus any other important tools such as a search box or accessibility links (access key information, style switcher, and so on). The footer tidies the whole thing up at the base of the layout, again stretching the full width of any columns. The footer is typically used to store important information such as copyright info, links to legal information (accessibility statement, terms and conditions, etc.).

A Liquid floated two column layout

We can now think about the structural HTML needed to divide the page into specific sections. Remember that every time you create a new column `<div>`, you also create a new parent element for any elements it contains. This means that you can be even more specific with your CSS and how you target certain elements using contextual selectors.

The structural HTML can now be
