

```
...footer content goes here...  
</div>
```

The CSS code would look like,

```
/* Content */  
#content {  
float:left;  
width:54%;  
margin-bottom:10px;  
padding:10px;  
border:1px solid #000;  
}  
/* Sidebar */  
#sidebar {  
float:right;  
width:36%;  
margin-bottom:10px;  
padding:10px;  
border:1px solid #000;  
}
```

If no padding was set for either ID, the two widths could be larger. You could use, for example, a content ID of 60 per cent width, and a sidebar ID of 36 per cent, which would give a space in between the two of 4 per cent. However, with 10 pixels of padding declared for each (totalling 40 pixels in width), the content ID has a smaller width of 54 per cent to compensate for this.

9.5 Liquid floated three-column layout

Let's jump back to the first floated sidebar example, where to succeed the sidebar element needs to be placed before the content element. Here's the HTML again, but notice that the sidebar ID has now been removed, and instead we have two new sidebars, one called `sidebar_a`, and one called `sidebar_b`, just above it.

```
<div id="masthead">  
...masthead content goes here...  
</div>  
<div id="sidebar_a">
```
