

```
}
/* Footer */
#footer {
clear:both;
padding:10px;
border:1px solid #000;
background-color:#CCC;
}
```

Notice that as the `sidebar_a` element appears first in the markup, and as of yet has no matching selector, it floats above the reworked columns. The next stage is to create a space to the left of the content ID in which the new sidebar can be floated. This calls for a left margin declaration for the content selector.

```
/* Content */
#content {
margin-left:30%;
margin-right:30%;
margin-bottom:10px;
padding:10px;
border:1px solid #000;
}
```

Finally, rules for the new `sidebar_a` ID are declared. The values are identical to those of the existing `sidebar_b`, except that in this instance `sidebar_a` is floated left.

```
/* Sidebar A */
#sidebar_a {
float:left;
width:25%;
margin-bottom:10px;
padding:10px;
border:1px solid #000;
}
```

Now that one sidebar is being floated left and one floated right, and owing to the adequate left and right margins of the content ID, all three columns are sitting perfectly, and will stretch and contract to fit the browser window without collapsing. You are about to witness the true power of CSS layout. Notice that in each sidebar, the list headings contain either an A or a B,
