

Next the existing CSS from the liquid floated three-column layout can be reworked for our fixed version. The first decision to make is how wide the layout should be.

For this example, the total width for the layout would be 760 pixels. The first step is to define this width in the body declaration.

```
/* Specify blanket rules for all elements */
body {
width:760px;
margin:10px;
font-size:80%;
font-family:'Lucida Grande', Verdana, sans-serif;
}
```

Doing this will ensure that any element floated right will not seek to stick to the right edge of the browser window.

With the figure of 760 pixels in mind, the properties of both masthead and footer need examining. Paying consideration to the Box Model, if both masthead and footer are to be 760 pixels in width, their specified width needs to be 760 pixels minus border and padding. That gives us $760 - 1 - 10 - 10 - 1 = 738$. Therefore the declared widths will be 738 pixels.

```
/* Masthead */
#masthead {
width:738px;
margin:0 0 10px 0;
padding:10px;
border:1px solid #000;
background-color:#CCC;
}
/* Footer */
#footer {
clear:both;
width:738px;
padding:10px;
border:1px solid #000;
background-color:#CCC;
}
```

Now the columns need to have their set widths declared.

Here, the final width value of the content ID is somewhat dictated by the fact that we need to allow for existing border, padding, and margins. Taking
