

```
}  
.music h3{  
background:#999;  
}
```

Then, all you need to decide is the purpose for each container. Let's say you add a container to house articles about sport. Add the sport attribute to the existing container class, separating the two class names with a whitespace character:

```
<div class="container sport">  
<h2>Sports News</h2>  
<h3>England win 26-0</h3>  
content  
</div>
```

Suddenly, all instances of a `<h3>` heading inside this container take on the light gray background colour. Exchange the word "sport" for "music" and now all headings in that container have a darker gray background. Remove the heading rule entirely, and headings have no background colour at all.

Now that you know all the basic commands and properties in CSS and how you can work with them, you can experiment and build your own techniques. The art of CSS can only be mastered by practice. Learning the concepts is a simple task, but you can create truly creative compelling content only once you have gained a lot of experience. If you like a site design, have a look at its source and check out its CSS. All the best.
