

```
/* Second container for the em example */
#secondbox {
margin:10px;
font-size:30px;
width:1em;
height:1em;
border:1px solid black;
}
```

Although both boxes have a height and width of 1em, the two different font sizes make one box larger than the other. The first box is 11px × 11px, and 1em × 1em. The second box is 30px × 30px but is also 1em × 1em. Thus each resulting em measurement is relative to whatever contains it. Further rules within #firstbox would be free to define measurements based on the em, knowing that it is equal to 11px.
