

Container with different borders

Applying simple borders to your divisions and other key elements is a brilliant way of creating a wire frame. Wire framing a design with a thin solid or dashed line around your divs can help you understand how one element relates to another, and also identify problems with alignment and juxtaposition. You can apply a simple dashed line to all divs, for example, using a base selector for the `<div>` tag:

```
/* Place a thin gray border around all divisions */
div {
border: 1px dashed #CCC;
}
```

This rule would be placed immediately after the body selector in the style sheet, and would ensure all divs you create inherit a thin grey border, unless you specify otherwise in that element's rule. To apply this rule to further base elements, simply group the selectors together:

```
/* Place a thin grey border around the following elements
*/
div, h1, h2, h3, h4, ul {
border: 1px dashed #CCC;
}
```
