

```
}
```

For this example, the `background-color` is set to transparent in order to ensure that the white background colour of the container does not prevent the custom bullet images from displaying. Also, by using `background-position` values `left center`, the background image is forced to display the same distance from the top and bottom of the list element. Appropriate left padding is also declared to allow enough space in front of the list text for the image to fall into.

6.1.4 The inline list

By default, unordered list items will display vertically, with each list item on a new line. This is because the `<li>` element is a block-level element. There are, however, many occasions when you will need your list to display horizontally, for a main navigation bar, for example. This calls for the default block-level value to be overridden using the `display` property. Let's strip back the styling from the previous examples and examine the basic behaviour.

```
/* Styles for our basic list */
```

```
ul {  
  list-style-type: disc;  
}  
li {  
  display: inline;  
}
```

Notice that the unordered list merely specifies the bullet marker type, and that it is the `li` selector that is now doing all the work. By giving `display` a value of `inline`; the default block display is overruled, forcing each list item to display on the same line. This is a great starting point for a horizontal menu, but what has happened to the bullet markers? The bullet will not show when `display` is set to `inline`. This brings us back to using background images with list items.

We have already seen how to apply a custom bullet as a background image in order to get around a few cross-browser display quirks. Using this approach allows you to assign a bullet for inline lists where default bullets refuse to be displayed. The CSS is fairly simple. Again, turn default bullets off in the `ul` selector, and ensure `display: inline` is declared in the `li` selector. Note also that the same background rules (transparent background and specific positioning) are declared.

```
ul {  
  list-style: none;
```
