

```
<li class="mixer">Cola</li>
<li class="mixer">Lemonade</li>
<li class="hot">Tea</li>
<li class="hot">Coffee</li>
</ul>
<ul id="food">
  <li>Food Menu</li>
  <li class="breakfast">Toast</li>
  <li class="breakfast">Cornflakes</li>
  <li class="dinner">Burgers</li>
  <li class="dinner">Steak</li>
  <li class="side">Salad</li>
  <li class="side">Fries</li>
</ul>
```

Note that the first list item has no class attribute, yet every other item is assigned a class. This allows each drinks and food group to be treated individually. As before, the classes for each drink type are defined with unique shades of gray for font colour, but this time we can also group foods using the same method, by grouping the declarations:

```
/* Define first food and drink group */
.alcohol, .breakfast {
color: #333;
}
/* Define second food and drink group */
.mixer, .dinner {
color: #999;
}
/* Define third food and drink group */
.hot, .side {
color: #CCC;
}
```

The result sees the list of items move from black (the basic unordered list colour “drinks” and “food”) through shades of gray (defined by the classes). Any further drinks or food added to the lists can be assigned to a particular drinks or food group, such as `<li class="side">Mashed Potato</li>`. Thus a logical colour key is established using simple CSS classes.
