

6.2 Nested lists

There will be many instances where you need to create a hierarchy in one list, and this is where nested lists are most useful. HTML allows you to begin an unordered list and create new lists inside that. The following markup takes the existing food and drinks menus and nests them inside one main list. It is very important to get the markup right in such scenarios, as to forget to close a top-level list item or nested list can cause all sorts of chaos.

```
<ul>
<li>Drinks Menu
<ul>
<li>Beer</li>
<li>Spirits</li>
<li>Cola</li>
<li>Lemonade</li>
<li>Tea</li>
<li>Coffee</li>
</ul>
</li>
<li>Food Menu
<ul>
<li>Toast</li>
<li>Cornflakes</li>
<li>Burgers</li>
<li>Steak</li>
<li>Salad</li>
<li>Fries</li>
</ul>
</li>
```

- 
- Drinks Menu
 - Beer
 - Spirits
 - Cola
 - Lemonade
 - Tea
 - Coffee
 - Food Menu
 - Toast
 - Cornflakes
 - Burgers
 - Steak
 - Salad
 - Fries
