

Figure 7-9: The finished navigation bar

```
.two {  
background:#DDDDDD url(images/ol2.gif) no-repeat 3px center;  
}  
.three {  
background:#DDDDDD url(images/ol3.gif) no-repeat 3px center;  
}  
.four {  
background:#DDDDDD url(images/ol4.gif) no-repeat 3px center;  
}  
.five {  
background:#DDDDDD url(images/ol5.gif) no-repeat 3px center;  
}  
.six {  
background:#DDDDDD url(images/ol6.gif) no-repeat 3px center;  
}
```

One further change is made to the shorthand background-position property for each custom number. Instead of left, a value of 3px is specified to pull the custom image away from the left border of the list item. The end result looks very similar to the earlier vertical navigation, except the custom numbers are in place.

The drawbacks of this technique are obvious, but the benefits are far-reaching. One drawback is that this method works well only for ordered lists that are unlikely to grow or be reordered, as you are now overruling the default browser action of reordering and number adjustment. A major positive is that you can now see how easy it is to take greater control of any kind of list, as the method of applying unique classes to list elements will of course work for unordered lists also.
