<?php
    echo '<p>This content was generated by PHP</p>';
?>
<p>And this content is static HTML</p>
</body>
</html>
```

Output:

PHP Output

From the above code it is evident that although PHP is easy to learn, it involves a lot of mechanical work. The output is just three sentences, whereas the code for that is relatively large. For more on PHP, you can read the Fast Track to PHP, in January 2009.

ASP.NET is object oriented. This means a .NET project is divided into sub-modules and objects. These objects interact with each other by sending messages. It enables re-usability of these objects and also enables adding new features without affecting code, that is, it provides extensibility. It also provides multilanguage support allowing you to break up your project into many parts, with each part written in a different .NET compatible language such as VB, C# and C++, and then merged easily. This way the project will get done faster. PHP on the other hand lacks multilanguage support. If your client is a company and is already working on Visual Studio, you can recommend ASP.NET. It provides a large set of libraries and all kinds of controls that can just be
