

compiles that information to update the Web site.

Always pick a CMS that has a good and simple interface that can be worked upon at ease. Without a clear definition of the requirements, it is not possible to get the right CMS. It will save you a lot of pain in the long run. Ensure that the CMS you need has all the functionalities required for the web site.

Never go by the look of it. Don't get attracted towards the fancy ads, the pretty themes and false promises the companies make, the plug-ins they claim to offer and so on. At the same time, don't go in for a very small one too. Also make sure you choose one that is quick and easy to install and does not eat into your time. Don't take your customer for granted, do consider your requirements. These requirements may be implicit, you have to put yourself in your customer's shoes and then decide. The CMS must also contain a good user community. Before selling hosting space, always try the CMS yourself. If possible don't go in for demo versions that are installed by the client. They will always give you better performance. Find a cheap host somewhere, install and use it first before picking it up for your web hosting.

If you don't find the right CMS for your web hosting, you can also make one as per your customer's needs. You should keep the following things in mind before building your own CMS:

You must take into consideration, the freedom of the owner. There are a set of rules you must consider. For instance, control over what to edit. Also, a level of abstraction should be provided from the customers depending on their roles. For example, a user may be allowed to update the general details of a web site whereas another user may be allowed to modify only his profile details.

Make it simple for the user. Ensure that your web is not loaded with details else it would take ages for the site to return results. Enable user interaction. If the customer has any suggestion he can mention it in the feedback forms so that further improvisation of the CMS can be made. The CMS you choose must have multi lingual support so that any user from any corner of the world can use the CMS. It should be video and audio compatible as nowadays no website works without videos and tutorials.

Now you have to recommend a CMS, depending on the platform your client has chosen. Initially you can provide him with free CMSs. Some customers run away from finding and installing the CMSs on their own. You must try and get a one click installer like simple scripts one click installation service on your web host.

Here's an example of the simple scripts installer with the Bluehost for installing WordPress.
