

cost and easily available.

Drupal is robust enough a CMS to run on LAMP server. In case of Drupal everything is object oriented and you have to define classes of data which can be displayed in different ways depending upon their context. There is a datatype called 'xml text field' in which users can enter markup, but this markup is then parsed on the server and outputted as valid xhtml.

Joomla is good to use. But like Drupal it is a lot more complicated and has a long learning curve compared to WordPress. WordPress is more blog centric than Drupal and Joomla. But if you are new then it is better

Adding a module in a .NET CMS
