

Assigning roles

change and maintain their own web sites without knowledge of HTML. The web content and page modifications can be made from any computer that has a web browser and an internet connection.

If the web site your customer needs is very small and simple, then you may not require providing the CMS. But nowadays no web site is as small that HTML alone would suffice. Having a CMS is a must in any case, as you are required to write more than a thousand lines of code if you wish to use only HTML. If you're planning to build a web site that is search engine friendly then you may want to go in for a content management system rather than building sites with plain HTML pages.

The above diagram gives you a clear idea about the fact that whenever your client updates his web site he just needs to make the changes at one place in the CMS and these changes get reflected in every page of the web site. He can alter the whole theme of the website instantly without having programming knowledge. You just have to keep clicking and you have
