

the web page you need. Now take a look at the HTML tags you require in order to get the same effect, a CMS gives you in just a few seconds.

```
<html>
<body>
<p>An image from another folder:</p>

<p>An image from W3Schools:</p>

</body>
</html>
```

This is the code for just one image if you want to insert many images, videos and audio, it will be a very tedious work to do.

3.2.2 Which CMS to choose?

Choosing a CMS is an important task. If your client also, like the crowd, opts for PHP and MySQL, and needs great flexibility, then you may want suggest him to go in for a CMS like Drupal or Joomla. You have to recommend the right CMS to your client. Suppose a home maker has opened a her own boutique and wants a website for the same. She has no knowledge of how to design a web page. We recommended her to buy a web hosting with WordPress CMS. Joomla and Drupal are very complicated for beginners.

However we also had these geeky curious students coming upto us. In this case we told them to try out Drupal or Joomla, preferably Drupal. Drupal can host blogs, forums, and a variety of other contents on the website. It is developer friendly, users will find it difficult to use. It is considered to be the best. It is used by some prominent web sites such as YouTube, BBC and MTV. Although it is very complicated and has a tough user interface, it is widely used by most of the popular web sites.

Video heavy sites require a high quality CMS that is stable under heavy load. It needs to be efficient at balancing your client's multimedia content well. Drupal or Joomla fits in this bill perfectly and efficiently. Again, you can suggest using even a basic platform such as WordPress to create a video heavy site by embedding videos from YouTube. You can have a Flash player built in that plays these videos. The advantage is that your client need not bother about using up your server bandwidth or hosting space. The only space he'd use up is that of typing out the URL of the video! Drupal is much more powerful than Joomla. If you're not able to work with either of the two because of the complexity involved, you can try WordPress. Again, WordPress is not the ideal choice for video heavy
