

through a reseller chain network, and the other who sell space as affiliates who simply refer customers and resellers to the web services provider. You can have a reseller account of your own, being a first buyer and then in turn sell space to others.

This is more like the outsourcing industry. Work is let off to contractors, then there are sub-contractors and then when there is too much to handle within the given deadline, you have sub-sub-contractors, with a long list.

Once you start looking for a reseller account, you'll realise companies use several methods to push a product down your throat. First, there are web sites that sell reseller accounts with a fixed web space. For example, a 50 GB space with unlimited web sites and email addresses is what one Indian company advertises. Seems reasonable probably. However, if you have 50 GB of space, you could certainly host several web sites

on it without any extra effort. Then why pay more for that? A reseller account should, understandably, be unlimited in every area. Be it space, number of databases, number of email addresses whatever. After all, these are psychological figures. Unless you're building the next Google or Facebook almost instantly from scratch, you wouldn't need

unlimited everything anyway. Giving it deeper thought, this is obviously a sub-reseller of sorts, who is trying to ensure they have several customers paying them money so that they make up their own investment in the reseller account they have purchased.

Then there are several site builder configurations that are commonly available. Some companies let you build a small brochure online for a minuscule fee. These are ways you can identify other sub-resellers, or affiliates as they're also known. Affiliates are those who use one services and directly or indirectly refer others to use this service. Similarly, if you want to build a basic web site then you can add several pages with some basic interaction, suitable to most small companies. Then there is a wholly dynamic page with shopping carts that would cost extra. Each function and its implementation would cost you. However what you need to check is whether the pricing is reasonable and justifiable. Some companies charge you because you are unaware. Others, for genuine investment in the infrastructure. Look at the perceived credibility of the company. You'll be able to gather a fair idea by looking at communities and user opinions online. These give you an honest rating of the service provider.
