

SQL databases

Practically, for small web sites, it doesn't matter whether they share a database or are on a different database. When web sites share a database, they are on different tables. While some reseller accounts would provide you with a cap on the available space, others are unlimited in all ways. Even if you have a basic hosting account that lets you sell hosting space, you can still manage multiple websites on a single MySQL database by naming tables accordingly. You can do this by sharing different tables with different names. For example, you can host your friend's pet web site in the tables with prefix `pet_` and for your florist you can add `florist_`. Although these would result in longer names, does it really

matter? After all you won't be typing

them on a day to day basis anyway! After all, if you have to sit and access your database everyday for troubleshooting, then that doesn't pay to tell something is wrong somewhere. Either with your decision on the hosting provider, or your CMS. First things first, you just need to change the service or upgrade your skills. If your business, which in most cases will be, more priority, then changing the service/service provider just seems to be the obvious choice.

Services and features

There are additional services and features that are often neglected that you should consider. In moments of emergencies, you would want absolutely all the access to help you could ever think of, even if you don't use it. The very fact that you have additional channels to access for help is assuring and awarding by itself. We spoke to Kirti Singh, Manager (Technical), Pack Web Hosting (www.packwebhosting.com). Pack is a ResellerClub affiliate.

When asked why they chose ResellerClub, Singh replies, "Apart from the great synergy between us, it's preferable to deal with a company based nearby with the same timezone and currency."

Q. When did you enter the Web Services Industry and where do see your business going?
