

The general norm for the length of this description is 250 characters, but Google will just about display the first 100. Still, the rest of the characters are indexed none the less. Here's an example of a Description Meta tag that you can use for your own website: `<META NAME="DESCRIPTION" CONTENT="Best website for cheap domain registration and best prices for web hosting plans in India. Full web development and web designing services offered">`. These two techniques of using a title tag properly and Meta description tag will help you get started in the slightly complex world of search engine optimisation.

Yet there are other things that you can do. Search engines consider words appearing in the Header tags `<H1>`, `<H2>`, etc. to be important as far as the description of the page is concerned. Search engines usually don't respond well to CSS to figure out which are the important keywords. Hence it's important to use these good old tags for better optimisation.

6.5.1 Other Search Engine Marketing tips

It's all about keywords, keywords and more accurate keywords. You need to come up with a list of keywords such as "web hosting, domain registration, cheap, affordable, reliable etc. etc." and use them appropriately. Some of the other tricks of the trade include positioning these keywords in the first paragraph of your page. Google's image search is also a good way to land visitors to your site. If you've used images in abundance, you might want to use descriptive keywords in the ALT attribute of image tags. That's the text that you see when you hover your mouse over images for a certain time. Hyperlinking keywords is also important. Plus the pages that

Check out Google Webmaster Central

It is a very useful resource for first time webmasters. Basically, a one-stop shop for webmaster resources that will help with your crawling and indexing questions, introduce you to offerings that can enhance and

increase traffic to your site, and connect you with your visitors. Head over to www.google.com/webmasters/. The community here is very active and has literally hundreds of discussions going on about lots of topics under the sun including crawling, page ranking, indexing and SERPs. You'll get answers to some of your simplest queries such as "Is it better to use subfolders or subdomains?" etc.

the hyperlinks point to should be named appropriately. For instance the page showing your various offers and prices could be named `web_hosting_pricing_details.htm`. This way search engines know exactly what can be found on that page. Your websites sitemap and navigation system should be friendly to search engines. While JavaScript and Flash navigation menus look attractive, they don't play nice with search engines. To counter this, what you need to do is put in regular HTML links at the bottom of the page. This ensures that hyperlinks exists that take a
