

7.1 Plugins

7.1.1 Drupal

Views (drupal.org/project/views)

This module is available to change the basic view of the page in terms of contents or tables/lists. If you want to arrange things and items on your page in a different manner or want to put the five most recent posts in a box then Views would do the trick for you in a simple efficient manner.

Tokens (drupal.org/project/token)

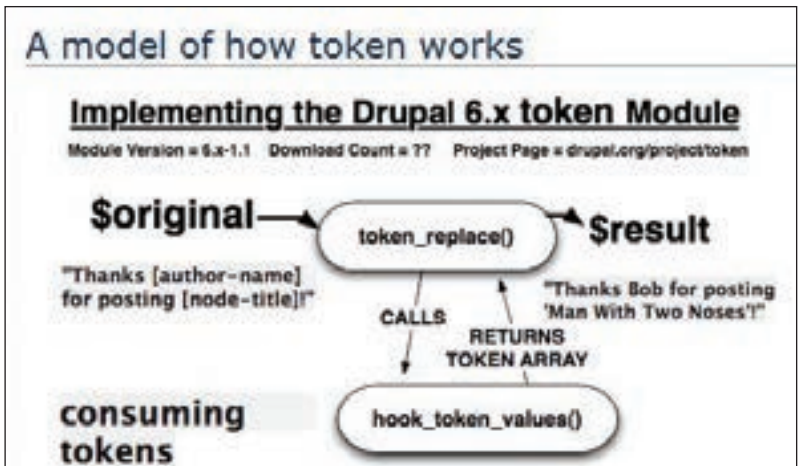

If you want to put a small text near to a larger document like %site-name or [user] then the token module will automatically take text tags and replace it with the appropriate text.

Content Construction Kit (drupal.org/project/cck)

Add custom fields to nodes using web browsing using Content Construction Kit. Most of the Content Construction Kit CCK module has moved to Drupal 7.

Pathauto (drupal.org/project/pathauto)

This module automatically generates path aliases for different kinds of content for eg: nodes, categories, users without the user having to manually input the path alias. This allows the user to get alias like /category/my-node-title.html instead of /node/123. These alias are based on a certain pattern which the administrator can control.

Automate your replies with Token
