

CAPTCHA (drupal.org/project/captcha)

The main function of CAPTCHA is to make sure that the empty fields which are required to be filled before an account creation is done by humans and not computers. Often placed with web forms the CAPTCHA is a challenge response test. Automated scripts are generated by spambots which spam the content wherever possible CAPTCHA's purpose is to stop this from happening.

With Captcha, ensure your visitors are humans!

Advanced Help (drupal.org/project/advanced_help)

Developers can use Advanced Help if they want to create a separate pure .html page to provide additional information for their content. It has ease of use as the files can be simply translated into the right directories by copying them in their appropriate directory. This can be made to appear in popup view. After installation of this module is complete, users with the view advanced help index permission can access the advanced help index by going to **Administer > Advanced Help**.

Poormanscron (drupal.org/project/poormanscron)

Poormanscron runs the cron operation without having the need to install the cron application. This module does not require the cron.php script. This module inserts a Javascript on each page of your website and calls for AJAX request after the last cron run. This module demands that your site is visited on a regular basis or gets good amount of traffic in order for the cron to trigger.

Link find it on drupal.org/project/link

This module lets you add a complete link to all your content types, based on the CCK based content field the Link module provides the following fields

- URL (textfield)
- Title (textfield)
- Open New Window (checkbox)
- Add rel=nofollow attribute

Webform (drupal.org/project/webform)

The Webform module simply adds on a webform node to your Drupal site.
