

Webform is used when the administrator wants to gather demographic or geographic data of the user before an account creation. Other uses of webform include contact or request/register forms, polls, questionnaires, surveys etc. The submissions made to the webform are saved in a database table and can be mailed to a specific email id, mostly to site administrators.

Nodewords (drupal.org/project/nodewords)

This module allows you to create tags for your Drupal site. With better description of your meta tags and keywords the nodes give you better search positioning.

Open Search (drupal.org/project/openserachplugin)

If you want to have browser search integration then the Open Search plugin protocol is the module you want to add to your Drupal site. This module adds a search add on for Internet Explorer 7 and Firefox to Drupal sites.

Tetris (drupal.org/project/tetris)

If you want your visitors to have some fun time on your website then the Tetris plugin is one module to get. This classic game's images and background can be themed to your website. The user who beats the highest score has his name saved. Size of the blocks, speed and key controls can be configured.

G Translate (drupal.org/project/gtranslate)

Make your website accessible to the majority of the internet users by using this plugin. It uses Google power to translate your content in 58 available languages.

Give your visitors some funtime

Ubercart (drupal.org/project/ubercart)

Ubercart is an e-commerce tool for Drupal. It is mainly based on three key areas store configuration, product and catalog creation, and order administration. Ubercart module gives the user flexibility to configure and integrate all major systems with standard Drupal system like (node, taxonomy, user, etc.).
