7.5 Defining specific templates for static pages

A static page contains content that is not displayed on the blog page, but as a separate page within your site. You can have numerous static pages on your site, and each page can have a different design, which is governed by the template you create. You can create several static-page templates and assign them to specific pages within your site by adding code to the top of the static-page templates. Using a template on a static page is a two-step process: Upload the template, and tell WordPress to use the template by tweaking the page's code.

7.5.1 Uploading the template

To use a page template, you have to create one. You can create this file in a text-editor program, such as Notepad. To create an About page, for example, you can name your template **about.php**. When you have your template created, follow these steps to make it part of WordPress:

1. Upload the template file to your WordPress theme folder.

You can find that folder on your Web server in **/wp-content/themes/**.

2. Log in to your WordPress Administration panel, click the Editor link on the Appearance menu.

3. Click the **about.php** template link located on the right side of the page.

4. Type the Template Name tag directly above the header template tag.

The header tag should be similar to `<?php get_header(); ?>`.

If you're creating an About Page, the code to create the Template Name looks like this:

```
<?php
/*
Template Name: About Page
/*
?>
```

5. Click the Update File button. The file is saved and the page refreshes. If you created an About Page template, the **about.php** template is now called the About Page in the template list on the right side of the page. When you have the template created and named the way you want it, you assign that template to a page by following these steps:

1. Click the Add New link on the Pages menu.
