

### 8.3.5 boolean `isInterrupted()`

Tests whether or not *this* thread has been interrupted. This method can be used to discover whether any thread has been interrupted.

Also, calling this method does *not* change the interrupted status of its argument.

### 8.3.6 void `interrupt()`

Interrupts this thread. If called on a thread object that is already currently blocked, the blocking call (such as `sleep()` or `wait()`) complains about the `interrupt()` call and terminates with an `InterruptedException`.

Sends an interrupt message to a thread. The “interrupted” status of the thread is set to true. This doesn’t ask a question, it performs an action

## 8.4 void `wait()`

The thread itself calls the `wait()` method to wait for a specific condition to be satisfied.

### 8.4.1 boolean `isAlive()`

returns true if:

- `start()` has been called for the thread, and
- the thread is not yet dead, meaning
- the `run()` method has not yet finished and died.

### 8.4.2 String `getName()`

It returns the thread name for the thread.

### 8.4.3 void `setName( String n )`

It sets the thread name for the thread.

### 8.4.4 static void `dumpStack()`

It causes a dump of the execution stack at this instant.

```
public class MyThread extends Thread
{
    public MyThread( String n )
    {
        super( n );
        System.out.println( "MyThread Constructor" );
    }
}
```
