

prompt runs the application and then closes it instantly when it's finished. [Ctrl]+[F5] stops the application without closing the window when it's finished. The developer should see the results in the command prompt.

If everything goes well, your screen should look like this

Congratulations, you have just created your first working C# console application! Now that we know how to create, compile and execute a C# application, let's take a look at a detailed explanation of our C# source code file.

The HelloWorld sample we created is fairly elementary, yet precisely outlines the structure of a simple C# application:

```
using library_name;
namespace namespace_name
{
    class class_name
    {
        static void Main([string[] args])
        {
            // Application code goes here
        }
    }
}
```
