

C# on the other hand does not erase generic type information. This avoids the need for translating source which leads to the inefficiencies described above. In addition, this allows you to reflect on generic types, something that Java does not allow due to type erasure.

```
public class MyGenericClass<T>
{
    public void PrintMyType() { Console.WriteLine(this.
GetType().FullName); }
    public static void Test()
    {
        MyGenericClass<int> c1 = new MyGenericClass<int>();
        MyGenericClass<string> c2 = new
MyGenericClass<string>();
        c1.PrintMyType();
        c2.PrintMyType();
    }
}
```
