

12.9.2 Redesigned UI widgets

Widgets saved to the home screen on Honeycomb tablets are going to have a whole new level of functionality available. Rather than passively relaying information to the user, they'll be interactive. Gestures can be used to scroll through 3D stacks or lists of content, while touch gestures can also flip and move the widget's innards like never before.

The new UI widgets are redesigned for use on larger screens such as tablets and incorporate the new holographic UI theme. Several new widget types will be available, including a 3D stack, search box, a date/time picker, number picker, calendar, popup menu, and others. Most of the redesigned UI widgets will now be able to be used as remote views in application widgets displayed on the home screen.

12.9.3 Expanded Home screen widgets

Developers will be able to use more standard UI widget types home screen widgets, including widgets that let users flip through collections of content as 3D stacks, grids, or lists. You will be able to interact with the home screen widgets in new ways, such as by using touch gestures to scroll and flip the content displayed in a widget.

12.9.4 Persistent Action Bar

The platform will provide each application with its own instance of the Action Bar at the top of the screen, which the application can use to give the user quick access to contextual options, widgets, status, navigation, and more. The Action Bar will let the developers expose more features of their applications to users in a familiar location, while also unifying the experience of using an application that spans multiple Activities or states.
