

and add-ons you installed along with your SDK. Choose one of the Android add-ons (like ‘Android 2.2’ for this program)

- **Project Properties:** The application name will be any English name you want to give your application, say ‘Hello World!’
- **Package name:** is a Java construct, where all source code is organized into packages. Packages are important as they specify visibility of objects between the various Java

Files automatically created by Eclipse

Hello World

classes. In Android, packages play a pivotal role for application signing purposes. A package name should be the reverse of your domain name, for instance ‘com.thinkdigit.android’

- **Create Activity:** Activities correspond to various screens of your application. It is also represented by a Java class, hence you should adhere to Java class naming conventions, i.e. start with an upper case letter, and use upper case letters to separate words (no spaces). Here our Activity name will be ‘HelloWorld’.
- **Minimum SDK Version:** Minimum version of the SDK represented by API level, required to run the application. This number should be as low as possible to allow scalability of your application to as many users as possible. We keep it ‘8’ here.
