

```
// Handles the connection between the service and activity
private ServiceConnection mConnection = new ServiceConnection()
{
    public void onServiceConnected(ComponentName className,
IBinder service) {
        // Called when the connection is made.
        serviceBinder = ((MyService.MyBinder)service).
getService();
    }

    public void onServiceDisconnected(ComponentName className)
    {
        // Received when the service unexpectedly disconnects.
        serviceBinder = null;
    }
};
```

To perform the binding, call `bindService`, passing an `Intent` (either explicit or implicit) that selects the `Service` to bind to an instance of your new `ServiceConnection` implementation:

```
@Override
public void onCreate(Bundle savedInstanceState) {
    super.onCreate(savedInstanceState);

    // Bind to the service
    Intent bindIntent = new Intent(MyActivity.this, MyService.
class);
    bindService(bindIntent, mConnection, Context.BIND_AUTO_
CREATE);
}
```

Once the `Service` has been bound, all of its public methods and properties are available through the `serviceBinder` object obtained from the `onServiceConnected` handler.

Android applications don't (normally) share memory, but in some cases your application may want to interact with (and bind to) `Services` running in different application processes.
