

5.6.2 Using Toasts in Worker Threads

As GUI components, Toasts must be opened on the GUI thread or you risk throwing a cross-thread exception. In the following code, a Handler is used to ensure that the Toast is opened on the GUI thread.

```
private void mainProcessing() {
    Thread thread = new Thread(null, doBackgroundThreadProcessing,
                                "Background");

    thread.start();
}

private Runnable doBackgroundThreadProcessing = new Runnable()
{
    public void run() {
        backgroundThreadProcessing();
    }
};

private void backgroundThreadProcessing() {
    handler.post(doUpdateGUI);
}

// Runnable that executes the update GUI method.
private Runnable doUpdateGUI = new Runnable() {
    public void run() {
Context context = getApplicationContext();
        String msg = "To open mobile development!";
        int duration = Toast.LENGTH_SHORT;
        Toast.makeText(context, msg, duration).show();
    }
}; d
```
