

```
if (respondForIndex < 1)
// If "disabled" is selected, cancel the alarm.
alarms.cancel(intentToFire);
else {
    // Otherwise find the length of time represented
    // by the selection and and set the alarm to
    // trigger after that time has passed.
    Resources r = getResources();
    int[] respondForValues =
        r.getIntArray(R.array.respondForValues);
    int respondFor = respondForValues [respondForIndex];

    long t = System.currentTimeMillis();
    t = t + respondFor*1000*60;

    // Set the alarm.
    alarms.set(AlarmManager.RTC_WAKEUP, t, intentToFire);
}
}
```

9. That completes the AutoResponder, but before you can use it, you'll need to add it to your application manifest.

```
<?xml version="1.0" encoding="utf-8"?>
<manifest
    xmlns:android="http://schemas.android.com/apk/res/android"
    package="com.paad.emergencyresponder">
    <application
        android:icon="@drawable/icon"
        android:label="@string/app_name">
        <activity
            android:name=".EmergencyResponder"
            android:label="@string/app_name">
            <intent-filter>
            <action android:name="android.intent.action.MAIN" />
            <category android:name="android.intent.category.LAUNCHER" />
            </intent-filter>
        </activity>
```
