

ACTION action will be broadcast to asynchronously announce that the scan is complete and results are available.

Call `getScanResults` to get those results as a list of `ScanResult` objects.

Each Scan Result includes the details retrieved for each access point detected, including link speed, signal strength, SSID and the authentication techniques supported.

To initiate a scan for access points that display a Toast indicating the total number of access points found and the name of the access point with the strongest signal:

```
// Register a broadcast receiver that listens for scan results.
registerReceiver(new BroadcastReceiver() {
    @Override
    public void onReceive(Context context, Intent intent) {
        List<ScanResult> results = wifi.getScanResults();
        ScanResult bestSignal = null;
        for (ScanResult result : results) {
            if (bestSignal == null ||
                WifiManager.compareSignalLevel(bestSignal.
level,result.level)<0)
                bestSignal = result;
        }

        String toastText = String.format("%s networks found. %s is
the strongest.",
results.size(),
bestSignal.SSID);
        Toast.makeText(getApplicationContext(), toastText, Toast.
LENGTH_LONG);
    }
}, new IntentFilter(WifiManager.SCAN_RESULTS_AVAILABLE_ACTION));
// Initiate a scan.
wifi.startScan();
```

8.4 Managing Wi-Fi Configurations

You can use the Wi-Fi Manager to manage the configured network settings and control which networks to connect to. Once connected, you can interrogate the active network connection to get additional details of its configuration and settings.
