

wide evolution towards richer devices, to rapidly address opportunities and to focus on differentiation in their target markets.

Open Source Developers

The MeeGo project is a true open source project hosted by the Linux Foundation and governed by best practices of open source development. From meego.com, as an open source developer, you have access to tools, mailing lists, discussion forum, accessibility to technical meetings, and multiple options to make your voice heard over technical and non-technical MeeGo related topics. Furthermore, all source code contributions needed for MeeGo will be submitted to the upstream open source projects from which MeeGo will be built.

Application developers

MeeGo greatly expands the market opportunities for you being the only open source software platform that supports deployments across many computing device types. MeeGo offers Qt and Web runtime for application development, cross platform environments, so application developers can write their applications once and deploy easily on many types of MeeGo devices or even on other platforms supporting the same development environment.

In addition, MeeGo application developers will the opportunity to make their applications available from multiple application stores such as the Nokia's Ovi Store (<https://store.ovi.com>) and the Intel's AppUp Center (<http://www.intel.com/consumer/products/appup.btm>).

Device manufacturers

MeeGo helps accelerate time to market using an off-the-shelf, open source and optimised software stack targeted for the specific hardware architecture the device manufacturer is supporting. This helps the device manufacturer as MeeGo lowers complexities involved in targeting multiple device segments by allowing the use of the same software platform for different client devices. Also, as an open source project, MeeGo enables device manufacturers to participate in the evolution of the software platform and build their own assets for it through the open development model.

Operators

For operators, MeeGo enables differentiation through user interface customization. Although many devices can be running the same base software platform, they can all have different user experiences. Furthermore, it provides a single
