

```

•
• 51 void FindDialog::enableFindButton(const QString &text)
• 52 {
• 53     findButton->setEnabled(!text.isEmpty());
• 54 }

```

The `findClicked()` slot is called when the user clicks the Find button. It emits the `findPrevious()` or the `findNext()` signal, depending on the Search backward option. The emit keyword is specific to Qt; like other Qt extensions it is converted into standard C++ by the C++ preprocessor.

The `enableFindButton()` slot is called whenever the user changes the text in the line editor. It enables the button if there is some text in the editor, and disables it otherwise. These two slots complete the dialog.

Testing

We can now create a `main.cpp` file to test our `FindDialog` widget:

```

• 1 #include <QApplication>
•
• 2 #include "finddialog.h"
•
• 3 int main(int argc, char *argv[])
• 4 {
• 5     QApplication app(argc, argv);
• 6     FindDialog *dialog = new FindDialog;
• 7     dialog->show();
• 8     return app.exec();
• 9 }

```
