

Signal Handlers

Signal handlers allow JavaScript code to be executed in response to an event. For example, the `MouseArea` element has an `onClicked` handler that can be used to respond to a mouse click. Below, we use this handler to print a message whenever the mouse is clicked:

```

• Item {
•     width: 100; height: 100
•
•     MouseArea {
•         anchors.fill: parent
•         onClicked: {
•             console.log("mouse button clicked")
•         }
•     }
• }

```

All signal handlers begin with “on”.

Some signal handlers include an optional parameter. For example the `MouseArea` `onPressed` signal handler has a `mouse` parameter that contains information about the mouse press. This parameter can be referred to in the JavaScript code, as below:

```

• MouseArea {
•     acceptedButtons: Qt.LeftButton | Qt.RightButton
•     onPressed: {
•         if (mouse.button == Qt.RightButton)
•             console.log("Right mouse button pressed")
•     }
• }

```
