

browser_action in the manifest, or call the setPopup() method.

For the best visual impact, follow these guidelines:

- ▶ Use browser actions for features only when necessary. If they make sense only for few pages, use page action instead
- ▶ Do use big, colourful icons that make the most of the 19x19-pixel space. Browser action icons should seem a little bigger and heavier than page action icons.
- ▶ Soften the edges of your icon as it goes better with different themes that people use.
- ▶ Animated icons are annoying.

Page actions

To put icons inside the address bar, you need page actions. Page actions represent actions that can be taken on the current page, but that aren't applicable to all pages. For example, subscribing to RSS feeds or making a collage from the photos on the page.

Subscribe to RSS feed with a single click

To make your

extensions icon always visible, you should use browser actions.

After including page action in your manifest, it should look something like this:

```

• {
•   "name": "My extension",
•   ...
•   "page_action": {
•     "default_icon": "icons/foo.png", // optional
•     "default_title": "Do action",    // optional; shown
in tooltip
•     "default_popup": "popup.html"   // optional
•   },
•   ...
• }

```

Similar to browser actions, page actions can have an icon, a tooltip, and popup but they can't have badges. Page actions are not always visible, you can configure them to manage their appearance.
