

the rise. As a developer adept with RIA technologies, you can have a career ensured with top class placement in the programming and IT industry. With the increasing dependency on building and developing content for browsers, desktops and mobile platforms, this sort of talent is being sought after with great demand by all modern IT and web companies.

Frameworks are the platforms on which an RIA is built and deployed. There are a lot of different RIA frameworks. One of the biggest such platform for RIA development as already discussed is offered by Adobe which includes Adobe Flash, Flex and AIR. Another such framework by Microsoft is Silverlight. There is also an Open Source Silverlight project for the Linux operating system. Curl is an RIA framework designed for business use. Curl though does not focus on graphics and advertising, rather on applications that integrate with business data systems. Other important RIA frameworks include Google Web Toolkit, JavaFX, Mozilla Prism and OpenLazlo.

RIA development can be done through a variety of frameworks and technologies. For the back end, one can make use of programming languages like Java, ColdFusion, PHP, Rails, .NET, etc. For the client side you can use established MVC frameworks including Flex/ActionScript and Ajax, some emerging ones for Silverlight, and adapted Java frameworks for JavaFX. The primary quality for a developer is the ability to be able to define the needs and capabilities of your application well if you want to determine both the back-end and the front-end application architecture well.

YouTube is one of the biggest examples of the success of RIA technologies. It is increasingly delivering full length movies and live streaming events, and doing this without any issues or interruptions often requires fine control over buffering and dynamic quality control. Kuan Yong, platforms product manager for Google's YouTube, says that despite his company's efforts to make YouTube videos run in an HTML5 player, Flash isn't going anywhere. "Flash Player addresses these needs by letting applications manage the downloading and playback of video via Actionscript in conjunction with either HTTP or the RTMP video streaming protocol," explains Yong. "The HTML5 standard itself does not address video streaming protocols, but a number of vendors and organizations are working to improve the experience of delivering video over [HTTP](#)." YouTube also has to offer copy protection for some videos, like YouTube Rentals. The Flash Platform's RTMPE protocol is compatible with copyright protection technology, but HTML5 is not. Flash also remains the preferred option for video embedding. In conjunc-
